

Self-Introduction Essay

20142697 Min Su Kwon

My name is Min Su Kwon, I'm currently in a junior year majoring Software Engineering at Kookmin University. I started my freshman year as a different major, which was Management Information System. But after coming back from military duty, I decided to change my major to Software Engineering because I had a lot of interest in making Softwares and learning things about computer. Since then, I have been studying hard about Software Engineering, which is leading to good grades on most of the courses.

I've acquired software skills by taking courses and self-studying. My tech skills include proficient usage of programming languages such as C++, Python, Java, Javascript and SQL engineering skills using MySQL. I've finished several projects using Java, Python, and C++. These projects include *GUI Hanabi board game project* using Java and JavaFX library, *GUI Scrabble project* using Python and PyQt library, *TUI Battleship project* using C++ and ncurses library. I also have acquired 'SQLD' certificate from KDATA, which requires high level of understanding on SQL. Other than the tech skills, I can fluently speak English and have no problem communicating with native English speaker.

My thoughts on 'good software' is a software that is easy to be used by the user, no matter how difficult the software engineer developed it. So my dream is to be a good software engineer making 'good softwares'. My future plans to make my dream come true are to experience internship from different companies, to participate in different programs related to software inside and outside the college, to acquire other new and handy programming skills which will be added to my arsenal for software developing.
