All-Pairs Shortest Paths

Weight Matrix Representation

• Representation of weight matrix W in G = (V, E)

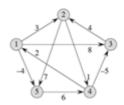

$$\begin{pmatrix} 0 & 3 & 8 & \infty & -4 \\ \infty & 0 & \infty & 1 & 7 \\ \infty & 4 & 0 & \infty & \infty \\ 2 & \infty & -5 & 0 & \infty \\ \infty & \infty & \infty & 6 & 0 \end{pmatrix}$$

since $V - 1 \le E < V^2$ in connected graphs, O(E) = O(V) in a sparse graph, $O(E) = O(V^2)$ in a dense graph

All-Pairs Shortest Paths

With Matrix Multiplication

• Let $l_{ij}^{(m)}$ be the minimum weight of any path from vertex i to j that contains at most m edges

$$\begin{split} l_{ij}^{(0)} &= \left\{ \begin{aligned} 0 & \text{if } i = j \ , \\ \infty & \text{if } i \neq j \ . \end{aligned} \right. \\ l_{ij}^{(m)} &= & \min \left(l_{ij}^{(m-1)}, \min_{1 \leq k \leq n} \left\{ l_{ik}^{(m-1)} + w_{kj} \right\} \right) \\ &= & \min_{1 \leq k \leq n} \left\{ l_{ik}^{(m-1)} + w_{kj} \right\} \ . \end{split}$$

- ㅇ shortest path는 최대 n-1 edges를 가지므로 $\delta(i,j)=l_{ij}^{(n-1)}$
- Taking as our input the matrix $W=(w_{ij})$, we now compute a series of matrices $L^{(1)},\ldots,L^{(n-1)}$, where for m = 1, 2, ..., n-1, we have $L^{(m)}=(l_{ij}^{(m)})$
